

MYC CISH Probe

Catalog # CG0021 Size 400 uL

Applications

Chromogenic *In Situ* Hybridization (FFPE Tissue)

Tetrasomy of chromosome 8 as indicated by four MYC signals per nucleus.

Specification

Product Description	MYC CISH Probe is designed for the qualitative detection of human MYC gene in formalin-fixed, paraffin-embedded specimens by chromogenic <i>in situ</i> hybridization (CISH).
Reactivity	Human
Recommend Usage	The product is ready-to-use. No reconstitution, mixing, or dilution is required. Bring probe to room temperature (18-25°C) and mix briefly before use.
Supplied Product	Reagent Provided: 1. Digoxigenin-labeled polynucleotides targeting sequences mapping in 8q24.21* (chr8:128,596,776-128,887,929) harboring the MYC gene 2. Formamide based hybridization buffer *according to Human Genome Assembly GRCh37/hg19
Probe Position	
Regulatory Status	For research use only (RUO)
Storage Instruction	Store at 2-8°C in an upright position. Return to storage conditions immediately after use.

Note

The probe is intended to be used in combination with the CISH Implementation Kit 1 (Catalog #: [KA5365](#)), which provides necessary reagents for specimen pretreatment and post-hybridization processing.

Hybridization signals of digoxigenin-labeled polynucleotides appear as brown- to dark brown colored distinct dots (MYC gene region).

Normal situation: In interphases of normal cells or cells without an amplification involving the MYC gene locus, two distinct dot-shaped brown signals per nucleus appear.

Aberrant situation: In a cell with amplification of the MYC gene locus or polysomy of chromosome 8, multiple copies of the brown signal or brown signal clusters will be observed. Other signal distribution may be observed in some abnormal samples which might result in a different signal pattern than described above, indicating variant rearrangements.

Unexpected signal patterns should be further investigated.

Interpretation of Result

Applications

- Chromogenic *In Situ* Hybridization (FFPE Tissue)

Tetrasomy of chromosome 8 as indicated by four MYC signals per nucleus.

Gene Info — MYC

Entrez GeneID [4609](#)

Gene Name MYC

Gene Alias bHLHe39, c-Myc

Gene Description v-myc myelocytomatosis viral oncogene homolog (avian)

Omim ID [113970 190080](#)

Gene Ontology [Hyperlink](#)

Gene Summary

The protein encoded by this gene is a multifunctional, nuclear phosphoprotein that plays a role in cell cycle progression, apoptosis and cellular transformation. It functions as a transcription factor that regulates transcription of specific target genes. Mutations, overexpression, rearrangement and translocation of this gene have been associated with a variety of hematopoietic tumors, leukemia and lymphomas, including Burkitt lymphoma. There is evidence to show that alternative translation initiations from an upstream, in-frame non-AUG (CUG) and a downstream AUG start site result in the production of two isoforms with distinct N-termini. The synthesis of non-AUG initiated protein is suppressed in Burkitt's lymphomas, suggesting its importance in the normal function of this gene. [provided by RefSeq]
