

CCND1 Split CISH Probe

Catalog # CS0004 Size 100 uL

Applications

Chromogenic *In Situ* Hybridization (FFPE Tissue)

Mantle cell lymphoma tissue section with translocation affecting the 11q13.3 locus as indicated by one non-rearranged red/green fusion signal, one red signal, and one separate green signal indicating the translocation.

Specification

Product Description	CCND1 Split CISH Probe is designed for the qualitative detection of translocations involving the human CCND1 gene at 11q13.3 in formalin-fixed, paraffin-embedded specimens by chromogenic <i>in situ</i> hybridization (CISH).
Reactivity	Human
Recommend Usage	The product is ready-to-use. No reconstitution, mixing, or dilution is required. Bring probe to room temperature (18-25°C) and mix briefly before use.
Supplied Product	Reagent Provided: This Probe is composed of: 1. Digoxigenin-labeled polynucleotides, which target sequences mapping in 11q13.3* (chr11:68,522,105-68,705,283) proximal to the CCND1 breakpoint region. 2. Dinitrophenyl-labeled polynucleotides, which target sequences mapping in 11q13.3* (chr11:69,453,301-70,031,240) distal to the CCND1 breakpoint region. 3. Formamide based hybridization buffer. *according to Human Genome Assembly GRCh37/hg19

Probe Position

Regulatory Status	For research use only (RUO)
Storage Instruction	Store at 2-8°C in an upright position. Return to storage conditions immediately after use.
Note	The probe is intended to be used in combination with the CISH Implementation Kit 2 (Catalog #: KA5366), which provides necessary reagents for specimen pretreatment and post-hybridization processing. Interpretation of results: Using the CISH Implementation Kit 2 (Cat # KA5366), hybridization signals of Digoxigenin-labeled polynucleotides appear as dark green colored distinct dots (proximal to the CCND1 breakpoint region), and Dinitrophenyllabeled polynucleotides appear as bright red colored distinct dots (distal to the CCND1 breakpoint region). Normal situation: In interphases of normal cells or cells without a translocation involving the CCND1 gene region, two red/green fusion signals appear. Aberrant situation: One CCND1 gene region affected by a translocation is indicated by one separate green signal and one separate red signal. Overlapping signals may appear as brown signals. Genomic aberrations due to small deletions, duplications or inversions might result in inconspicuous signal patterns. Other signal patterns than those described above may be observed in some abnormal samples. These unexpected signal patterns should be further investigated.

Interpretation of Result

Applications

- Chromogenic *In Situ* Hybridization (FFPE Tissue)

Mantle cell lymphoma tissue section with translocation affecting the 11q13.3 locus as indicated by one non-rearranged red/green fusion signal, one red signal, and one separate green signal indicating the translocation.

Gene Info — CCND1

Entrez GeneID	595
Gene Name	CCND1
Gene Alias	BCL1, D11S287E, PRAD1, U21B31
Gene Description	cyclin D1
Omim ID	151400 168461 193300 254500
Gene Ontology	Hyperlink

Gene Summary

The protein encoded by this gene belongs to the highly conserved cyclin family, whose members are characterized by a dramatic periodicity in protein abundance throughout the cell cycle. Cyclins function as regulators of CDK kinases. Different cyclins exhibit distinct expression and degradation patterns which contribute to the temporal coordination of each mitotic event. This cyclin forms a complex with and functions as a regulatory subunit of CDK4 or CDK6, whose activity is required for cell cycle G1/S transition. This protein has been shown to interact with tumor suppressor protein Rb and the expression of this gene is regulated positively by Rb. Mutations, amplification and overexpression of this gene, which alters cell cycle progression, are observed frequently in a variety of tumors and may contribute to tumorigenesis. [provided by RefSeq]

Other Designations

B-cell CLL/lymphoma 1|G1/S-specific cyclin D1
