Gene Ontology	Hyperlink
Gene Summary	Chylomicron remnants and very low density lipoprotein (VLDL) remnants are rapidly removed fro m the circulation by receptor-mediated endocytosis in the liver. Apolipoprotein E, a main apoprot ein of the chylomicron, binds to a specific receptor on liver cells and peripheral cells. ApoE is ess ential for the normal catabolism of triglyceride-rich lipoprotein constituents. The APOE gene is ma pped to chromosome 19 in a cluster with APOC1 and APOC2. Defects in apolipoprotein E result in familial dysbetalipoproteinemia, or type III hyperlipoproteinemia (HLP III), in which increased pla sma cholesterol and triglycerides are the consequence of impaired clearance of chylomicron and VLDL remnants.
