Gene Summary	In vertebrates, the genes encoding the class of transcription factors called homeobox genes are f ound in clusters named A, B, C, and D on four separate chromosomes. Expression of these prote ins is spatially and temporally regulated during embryonic development. This gene is part of the A cluster on chromosome 7 and encodes a DNA-binding transcription factor which may regulate ge ne expression, morphogenesis, and differentiation. Three transcript variants encoding two different isoforms have been found for this gene. [provided by RefSeq
