Gene Ontology	<u>Hyperlink</u>
Gene Summary	This gene encodes a member of the adenylate kinase family of enzymes. The encoded protein is I ocalized to the mitochondrial matrix. Adenylate kinases regulate the adenine and guanine nucleoti de compositions within a cell by catalyzing the reversible transfer of phosphate group among thes e nucleotides. Five isozymes of adenylate kinase have been identified in vertebrates. Expression of these isozymes is tissue-specific and developmentally regulated. A pseudogene for this gene h as been located on chromosome 17. Three transcript variants encoding the same protein have be en identified for this gene. Sequence alignment suggests that the gene defined by NM_013410, N M_203464, and NM_001005353 is located on chromosome 1. [provided by RefSeq
