Gene Description	APEX nuclease (multifunctional DNA repair enzyme) 1
Omim ID	107748
Gene Ontology	Hyperlink
Gene Summary	Apurinic/aprimidinic (AP) sites occur frequently in DNA molecules by spontaneous hydrolysis, by DNA damaging agents or by DNA glycosylases that remove specific abnormal bases. AP sites are pre-mutagenic lesions that can prevent normal DNA replication so the cell contains systems to identify and repair such sites. Class II AP endonucleases cleave the phosphodiester backbone 5' to the AP site. This gene encodes the major AP endonuclease in human cells. Splice variants have been found for this gene; all encode the same protein. [provided by RefSeq]
Other Designations	AP endonuclease class II AP lyase APEX nuclease DNA-(apurinic or apyrimidinic site) lyase OTTHUMP00000163988 apurinic/apyrimidinic (abasic) endonuclease apurinic/apyrimidinic exonuclease deoxyribonuclease (apurinic or apyrimidinic) multifunctional DNA repair
