Gene Summary	The protein encoded by this gene is a lysosomal cysteine proteinase involved in bone remodeling and resorption. This protein, which is a member of the peptidase C1 protein family, is predomina ntly expressed in osteoclasts. However, the encoded protein is also expressed in a significant fra ction of human breast cancers, where it could contribute to tumor invasiveness. Mutations in this g ene are the cause of pycnodysostosis, an autosomal recessive disease characterized by osteosc lerosis and short stature. This gene may be subject to RNA editing.
