Gene Info — FCER1A

Entrez GeneID	2205
GeneBank Accession#	NM_002001.2
Protein Accession#	NP_001992.1
Gene Name	FCER1A
Gene Alias	FCE1A, FcERI
Gene Description	Fc fragment of IgE, high affinity I, receptor for; alpha polypeptide
Omim ID	147140
Gene Ontology	Hyperlink
Gene Summary	The IgE receptor plays a central role in allergic disease, coupling allergen and mast cell to initiate the inflammatory and immediate hypersensitivity responses that are characteristic of disorders such as hay fever and asthma. The allergic response occurs when 2 or more high-affinity IgE receptors are crosslinked via IgE molecules that in turn are bound to an allergen (antigen) molecule. A perturbation occurs that brings about the release of histamine and proteases from the granules in the cytoplasm of the mast cell and leads to the synthesis of prostaglandins and leukotrienes--potential effectors of the hypersensitivity response. The IgE receptor consists of 3 subunits: alpha, beta (MIM 147138), and gamma (MIM 147139); only the alpha subunit is glycosylated.[supplied by OMIM]
Other Designations	Fc IgE receptor, alpha polypeptide Fc epsilon RI alpha-chain Fc-epsilon RI-alpha high affinity immunoglobulin epsilon receptor alpha-subunit immunoglobulin E receptor, high-affinity, of mast cells, alpha polypeptide
