Gene Name HRG

Gene Alias DKFZp779H1622, HPRG, HRGP

Gene Description histidine-rich glycoprotein

Omim ID [142640](#)

Gene Ontology [Hyperlink](#)

Gene Summary This histidine-rich glycoprotein contains two cystatin-like domains and is located in plasma and platelets. The physiological function has not been determined but it is known that the protein binds heme, dyes and divalent metal ions. It can inhibit rosette formation and interacts with heparin, thrombospondin and plasminogen. Two of the protein's effects, the inhibition of fibrinolysis and the reduction of inhibition of coagulation, indicate a potential prothrombotic effect. Mutations in this gene lead to thrombophilia due to abnormal histidine-rich glycoprotein levels. [provided by RefSeq]

Other Designations histidine-proline rich glycoprotein|thrombophilia due to elevated HRG
