Gene Description myosin, light chain 4, alkali; atrial, embryonic

Omim ID [160770](#)

Gene Ontology [Hyperlink](#)

Gene Summary Myosin is a hexameric ATPase cellular motor protein. It is composed of two myosin heavy chains, two nonphosphorylatable myosin alkali light chains, and two phosphorylatable myosin regulatory light chains. This gene encodes a myosin alkali light chain that is found in embryonic muscle and adult atria. Two alternatively spliced transcript variants encoding the same protein have been found for this gene.
