Gene Summary	Signal-mediated nuclear import and export proceed through the nuclear pore complex (NPC), whi ch is comprised of approximately 50 unique proteins collectively known as nucleoporins. The 98 k D nucleoporin is generated through a biogenesis pathway that involves synthesis and proteolytic c leavage of a 186 kD precursor protein. This cleavage results in the 98 kD nucleoporin as well as a 96 kD nucleoporin, both of which are localized to the nucleoplasmic side of the NPC. Rat studie s show that the 98 kD nucleoporin functions as one of several docking site nucleoporins of transp ort substrates. The human gene has been shown to fuse to several genes following chromsome tr anslocatons in acute myelogenous leukemia (AML) and T-cell acute lymphocytic leukemia (T-ALL). This gene is one of several genes located in the imprinted gene domain of 11p15.5, an importa nt tumor-suppressor gene region. Alterations in this region have been associated with the Beckwi th-Wiedemann syndrome, Wilms tumor, rhabdomyosarcoma, adrenocortical carcinoma, and lung, ovarian, and breast cancer. Alternative splicing of this gene results in several transcript variants; h owever, not all variants have been fully described. [provided by RefSeq
