

# PAX5 293T Cell Transient Overexpression Lysate(Denatured)

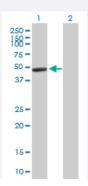

Catalog # H00005079-T02 Size 100 uL

## **Applications**

#### SDS-PAGE Gel

PAX5 transfected lysate.

#### Western Blot

Lane 1: PAX5 transfected lysate (42.10 KDa)

Lane 2: Non-transfected lysate.

| Specification           |   |
|-------------------------|---|
| Transfected Cell Line   | 293T  |
| Plasmid                 | pCMV-PAX5 full-length   |
| Host                    | Human   |
| Theoretical MW (kDa)    | 42.1  |
| Quality Control Testing | Transient overexpression cell lysate was tested with Anti-PAX5 antibody (H00005079-B01) by West ern Blots.  SDS-PAGE Gel PAX5 transfected lysate.  Western Blot Lane 1: PAX5 transfected lysate (42.10 KDa) Lane 2: Non-transfected lysate. |

## **Product Information**

| Storage Buffer      | 1X Sample Buffer (50 mM Tris-HCl, 2% SDS, 10% glycerol, 300 mM 2-mercaptoethanol, 0.01% Bro mophenol blue) |
|---------------------|--|
| Storage Instruction | Store at -80°C. Aliquot to avoid repeated freezing and thawing.  |

## **Applications**

Western Blot

| Gene Summary        | This gene encodes a member of the paired box (PAX) family of transcription factors. The central f eature of this gene family is a novel, highly conserved DNA-binding motif, known as the paired bo x. PAX proteins are important regulators in early development, and alterations in the expression o f their genes are thought to contribute to neoplastic transformation. This gene encodes the B-cell li neage specific activator protein that is expressed at early, but not late stages of B-cell differentiati on. Its expression has also been detected in developing CNS and testis and so the encoded prot ein may also play a role in neural development and spermatogenesis. This gene is located at 9p1 3, which is involved in t(9;14)(p13;q32) translocations recurring in small lymphocytic lymphomas of the plasmacytoid subtype, and in derived large-cell lymphomas. This translocation brings the pote nt E-mu enhancer of the IgH gene into close proximity of the PAX5 promoter, suggesting that the deregulation of transcription of this gene contributes to the pathogenesis of these lymphomas. Alt ernatively spliced transcript variants encoding different isoforms have been described but their bi ological validity has not been determined. [provided by RefSeq |
