Gene Description	ribosomal protein L9
Omim ID	603686
Gene Ontology	<u>Hyperlink</u>
Gene Summary	Ribosomes, the organelles that catalyze protein synthesis, consist of a small 40S subunit and a la rge 60S subunit. Together these subunits are composed of 4 RNA species and approximately 80 structurally distinct proteins. This gene encodes a ribosomal protein that is a component of the 60 S subunit. The protein belongs to the L6P family of ribosomal proteins. It is located in the cytoplas m. As is typical for genes encoding ribosomal proteins, there are multiple processed pseudogene s of this gene dispersed through the genome. Two alternatively spliced transcript variants encodin g the same protein have been found for this gene. [provided by RefSeq
