## Gene Info — RPL37A

**Entrez GeneID** [6168](#)

**GeneBank Accession#** [NM\\_000998.4](#)

**Protein Accession#** [NP\\_000989.1](#)

**Gene Name** RPL37A

**Gene Alias** MGC74786

**Gene Description** ribosomal protein L37a

**Gene Ontology** [Hyperlink](#)

**Gene Summary** Ribosomes, the organelles that catalyze protein synthesis, consist of a small 40S subunit and a large 60S subunit. Together these subunits are composed of 4 RNA species and approximately 80 structurally distinct proteins. This gene encodes a ribosomal protein that is a component of the 60S subunit. The protein belongs to the L37AE family of ribosomal proteins. It is located in the cytoplasm. The protein contains a C4-type zinc finger-like domain. As is typical for genes encoding ribosomal proteins, there are multiple processed pseudogenes of this gene dispersed through the genome. [provided by RefSeq]

**Other Designations** 60S ribosomal protein L37a
