Gene Name UGDH

Gene Alias GDH, UDP-GlcDH, UDPGDH, UGD

Gene Description UDP-glucose dehydrogenase

Omim ID [603370](#)

Gene Ontology [Hyperlink](#)

Gene Summary The protein encoded by this gene converts UDP-glucose to UDP-glucuronate and thereby participates in the biosynthesis of glycosaminoglycans such as hyaluronan, chondroitin sulfate, and heparan sulfate. These glycosylated compounds are common components of the extracellular matrix and likely play roles in signal transduction, cell migration, and cancer growth and metastasis. The expression of this gene is up-regulated by transforming growth factor beta and down-regulated by hypoxia. [provided by RefSeq]

Other Designations UDP-glucose 6-dehydrogenase|uridine diphospho-glucose dehydrogenase
