Gene Summary	Ribosomes, the organelles that catalyze protein synthesis, consist of a small 40S subunit and a la rge 60S subunit. Together these subunits are composed of 4 RNA species and approximately 80 structurally distinct proteins. This gene encodes a ribosomal protein that is a component of the 60 S subunit. The protein belongs to the L14P family of ribosomal proteins. It is located in the cytopla sm. This gene has been referred to as rpL17 because the encoded protein shares amino acid id entity with ribosomal protein L17 from Saccharomyces cerevisiae; however, its official symbol is RPL23. As is typical for genes encoding ribosomal proteins, there are multiple processed pseud ogenes of this gene dispersed through the genome. [provided by RefSeq
