Gene Description killer cell lectin-like receptor subfamily G, member 1

Gene Ontology [Hyperlink](#)

**Gene Summary** Natural killer (NK) cells are lymphocytes that can mediate lysis of certain tumor cells and virus-infected cells without previous activation. They can also regulate specific humoral and cell-mediated immunity. The protein encoded by this gene belongs to the killer cell lectin-like receptor (KLR) family, which is a group of transmembrane proteins preferentially expressed in NK cells. Studies in mice suggested that the expression of this gene may be regulated by MHC class I molecules. Alternatively spliced transcript variants have been reported, but their full-length natures have not yet been determined. [provided by RefSeq]

**Other Designations** C-type lectin domain family 15, member A|mast cell function-associated antigen (ITIM-containing)
