Gene Summary	Histone acetylation plays a key role in the regulation of eukaryotic gene expression. Histone acety lation and deacetylation are catalyzed by multisubunit complexes. The protein encoded by this ge ne is a component of the histone deacetylase complex, which includes SIN3, SAP30, HDAC1, H DAC2, RbAp46, RbAp48, and other polypeptides. This protein directly interacts with SIN3 and en hances SIN3-mediated transcriptional repression when tethered to the promoter. A pseudogene h as been identified on chromosome 2. [provided by RefSeq
