Gene Name	RRAGB
Gene Alias	RAGB, bA465E19.1
Gene Description	Ras-related GTP binding B
Gene Ontology	<u>Hyperlink</u>
Gene Summary	Ras-homologous GTPases constitute a large family of signal transducers that alternate between a n activated, GTP-binding state and an inactivated, GDP-binding state. These proteins represent c ellular switches that are operated by GTP-exchange factors and factors that stimulate their intrinsi c GTPase activity. All GTPases of the Ras superfamily have in common the presence of six conse rved motifs involved in GTP/GDP binding, three of which are phosphate-/magnesium-binding site s (PM1-PM3) and three of which are guanine nucleotide-binding sites (G1-G3). Transcript variant s encoding distinct isoforms have been identified. [provided by RefSeq
