Gene Ontology	<u>Hyperlink</u>
Gene Summary	Calpains are ubiquitous, well-conserved family of calcium-dependent, cysteine proteases. The cal pain proteins are heterodimers consisting of an invariant small subunit and variable large subunits . The large subunit possesses a cysteine protease domain, and both subunits possess calcium-bi nding domains. Calpains have been implicated in neurodegenerative processes, as their activati on can be triggered by calcium influx and oxidative stress. The function of the protein encoded by this gene is not known. An orthologue has been found in mouse but it seems to diverge from other family members. The mouse orthologue is thought to be calcium independent with protease activity. [provided by RefSeq
