Gene Name TSLP

Gene Alias -

Gene Description thymic stromal lymphopoietin

Omim ID [607003](#)

Gene Ontology [Hyperlink](#)

Gene Summary This gene encodes a hemopoietic cytokine proposed to signal through a heterodimeric receptor complex composed of the thymic stromal lymphopoietin receptor and the IL-7R alpha chain. It mainly impacts myeloid cells and induces the release of T cell-attracting chemokines from monocytes and enhances the maturation of CD11c(+) dendritic cells. Alternative splicing of this gene results in two transcript variants. [provided by RefSeq]
