

# ERBB2 (Human) ELISA Kit

Catalog # KA1070

Size 1 Kit

## Specification

|                            |                                                                                                         |
|----------------------------|---------------------------------------------------------------------------------------------------------|
| <b>Product Description</b> | Human ERBB2 ELISA kit is a sandwich enzyme immunoassay for the quantitative measurement of human ERBB2. |
| <b>Suitable Sample</b>     | Cell Culture Supernatant, Plasma (EDTA, Heparin), Serum, Tissue Homogenate                              |
| <b>Sample Volume</b>       | 100 $\mu$ L                                                                                             |
| <b>Label</b>               | HRP-conjugated                                                                                          |
| <b>Detection Method</b>    | Colorimetric                                                                                            |
| <b>Assay Type</b>          | Quantitative                                                                                            |
| <b>Calibration Range</b>   | 62.5 to 4000 pg/mL                                                                                      |
| <b>Reactivity</b>          | Human                                                                                                   |
| <b>Regulation Status</b>   | For research use only (RUO)                                                                             |
| <b>Storage Instruction</b> | Store at 4°C for 6 months, at -20°C for 12 months. Avoid multiple freeze-thaw cycles.                   |

## Applications

- Quantification

| Gene Summary       | This gene encodes a member of the epidermal growth factor (EGF) receptor family of receptor tyrosine kinases. This protein has no ligand binding domain of its own and therefore cannot bind growth factors. However, it does bind tightly to other ligand-bound EGF receptor family members to form a heterodimer, stabilizing ligand binding and enhancing kinase-mediated activation of downstream signalling pathways, such as those involving mitogen-activated protein kinase and phosphatidylinositol-3 kinase. Allelic variations at amino acid positions 654 and 655 of isoform a (positions 624 and 625 of isoform b) have been reported, with the most common allele, Ile654/Ile655, shown here. Amplification and/or overexpression of this gene has been reported in numerous cancers, including breast and ovarian tumors. Alternative splicing results in several additional transcript variants, some encoding different isoforms and others that have not been fully characterized. [provided by RefSeq] |
| Other Designations | c-erb B2/neu protein erbB-2 herstatin neuroblastoma/glioblastoma derived oncogene homolog v-erb-b2 avian erythroblastic leukemia viral oncogene homolog 2 (neuro/glioblastoma derived oncogene homolog)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
