

Aflibercept (Human) ELISA Kit (Quantitative)

Catalog # KA6851 Size 1 Kit

Applications

The standard curve is for the purpose of illustration only and should not be used to calculate unknowns. A standard curve should be generated each time the assay is performed.

Specification

Product Description	Aflibercept (Human) ELISA Kit (Quantitative) is a quantitative determination of free Aflibercept in serum and plasma.
Suitable Sample	Serum or Plasma
Sample Volume	5 uL
Absorbance (nm)	450/650 nm
Detection Method	Colorimetric
Assay Type	Quantitative
Calibration Range	30 - 1000 ng/mL
Limit of Detection	10 ng/mL
Reactivity	Human
Regulation Status	For research use only (RUO)
Quality Control Testing	Standard curve The standard curve is for the purpose of illustration only and should not be used to calculate unknowns. A standard curve should be generated each time the assay is performed.

Storage Instruction

Store the kit at 4°C.

Applications

- Quantification

Gene Info — VEGFA

Entrez GeneID	7422
---------------	----------------------

Gene Name	VEGFA
-----------	-------

Gene Alias	MGC70609, VEGF, VEGF-A, VPF
------------	-----------------------------

Gene Description	vascular endothelial growth factor A
------------------	--------------------------------------

Omim ID	125853 192240
---------	---

Gene Ontology	Hyperlink
---------------	---------------------------

Gene Summary	This gene is a member of the PDGF/VEGF growth factor family and encodes a protein that is often found as a disulfide linked homodimer. This protein is a glycosylated mitogen that specifically acts on endothelial cells and has various effects, including mediating increased vascular permeability, inducing angiogenesis, vasculogenesis and endothelial cell growth, promoting cell migration, and inhibiting apoptosis. Elevated levels of this protein is linked to POEMS syndrome, also known as Crow-Fukase syndrome. Mutations in this gene have been associated with proliferative and nonproliferative diabetic retinopathy. Alternatively spliced transcript variants, encoding either freely secreted or cell-associated isoforms, have been characterized. There is also evidence for the use of non-AUG (CUG) translation initiation sites upstream of, and in-frame with the first AUG, leading to additional isoforms. [provided by RefSeq]
