Gene Summary	This gene was identified as a tumor suppressor that is mutated in a large number of cancers at hi gh frequency. The protein encoded this gene is a phosphatidylinositol-3,4,5-trisphosphate 3-phos phatase. It contains a tensin like domain as well as a catalytic domain similar to that of the dual sp ecificity protein tyrosine phosphatases. Unlike most of the protein tyrosine phosphatases, this prot ein preferentially dephosphorylates phosphoinositide substrates. It negatively regulates intracellul ar levels of phosphatidylinositol-3,4,5-trisphosphate in cells and functions as a tumor suppressor by negatively regulating AKT/PKB signaling pathway.
