Gene Description

macrophage migration inhibitory factor (glycosylation-inhibiting factor)

Omim ID[153620 604302](#)**Gene Ontology**[Hyperlink](#)**Gene Summary**

This gene encodes a lymphokine involved in cell-mediated immunity, immunoregulation, and inflammation. It plays a role in the regulation of macrophage function in host defense through the suppression of anti-inflammatory effects of glucocorticoids. This lymphokine and the JAB1 protein form a complex in the cytosol near the peripheral plasma membrane, which may indicate an additional role in integrin signaling pathways. [provided by RefSeq]
