Gene Summary	The protein encoded by this gene is a member of the MAP kinase family. MAP kinases, also kno wn as extracellular signal-regulated kinases (ERKs), act in a signaling cascade that regulates vari ous cellular processes such as proliferation, differentiation, and cell cycle progression in respons e to a variety of extracellular signals. This kinase is activated by upstream kinases, resulting in its translocation to the nucleus where it phosphorylates nuclear targets. Alternatively spliced transcrip t variants encoding different protein isoforms have been described. [provided by RefSeq
