Entrez GenelD	250
Protein Accession#	<u>P05187</u>
Gene Name	ALPP
Gene Alias	ALP, FLJ61142, PALP, PLAP
Gene Description	alkaline phosphatase, placental (Regan isozyme)
Omim ID	<u>171800</u>
Gene Ontology	Hyperlink
Gene Summary	There are at least four distinct but related alkaline phosphatases: intestinal, placental, placental-lik e, and liver/bone/kidney (tissue non-specific). The first three are located together on chromosome 2 while the tissue non-specific form is located on chromosome 1. The product of this gene is a me mbrane bound glycosylated enzyme, also referred to as the heat stable form, that is expressed pri marily in the placenta although it is closely related to the intestinal form of the enzyme as well as to the placental-like form. The coding sequence for this form of alkaline phosphatase is unique in tha t the 3' untranslated region contains multiple copies of an Alu family repeat. In addition, this gene i s polymorphic and three common alleles (type 1, type 2 and type 3) for this form of alkaline phosp hatase have been well characterized. [provided by RefSeq
