Gene Summary	DNA methylation is the major modification of eukaryotic genomes and plays an essential role in m ammalian development. Human proteins MECP2, MBD1, MBD2, MBD3, and MBD4 comprise a f amily of nuclear proteins related by the presence in each of a methyl-CpG binding domain (MBD). Each of these proteins, with the exception of MBD3, is capable of binding specifically to methylat ed DNA. MECP2, MBD1 and MBD2 can also repress transcription from methylated gene promot ers. In contrast to other MBD family members, MECP2 is X-linked and subject to X inactivation. M ECP2 is dispensible in stem cells, but is essential for embryonic development. MECP2 gene mut ations are the cause of most cases of Rett syndrome, a progressive neurologic developmental di sorder and one of the most common causes of mental retardation in females.
