Gene Summary	The protein encoded by this gene belongs to a large family of proteins defined by an alpha/beta h ydrolase fold, and contains three sequence motifs that correspond to a catalytic triad found in the esterase/lipase/thioesterase subfamily. It differs from other members of this subfamily in that its p utative catalytic triad contains an asparagine instead of the serine residue. Mutations in this gene have been associated with Chanarin-Dorfman syndrome, a triglyceride storage disease with imp aired long-chain fatty acid oxidation. [provided by RefSeq
