Gene Info — ROCK1

Entrez GeneID	6093
Protein Accession#	Q13464

Gene Name	ROCK1
Gene Alias	MGC131603, MGC43611, P160ROCK, PRO0435
Gene Description	Rho-associated, coiled-coil containing protein kinase 1
Omim ID	601702
Gene Ontology	Hyperlink
Gene Summary	This gene encodes a protein serine/threonine kinase that is activated when bound to the GTP-bound form of Rho. The small GTPase Rho regulates formation of focal adhesions and stress fibers of fibroblasts, as well as adhesion and aggregation of platelets and lymphocytes by shuttling between the inactive GDP-bound form and the active GTP-bound form. Rho is also essential in cytokinesis and plays a role in transcriptional activation by serum response factor. This protein, a downstream effector of Rho, phosphorylates and activates LIM kinase, which in turn, phosphorylates cofilin, inhibiting its actin-depolymerizing activity. [provided by RefSeq]
