Gene Name	MAP2K3
Gene Alias	MAPKK3, MEK3, MKK3, PRKMK3
Gene Description	mitogen-activated protein kinase kinase 3
Omim ID	<u>602315</u>
Gene Ontology	Hyperlink
Gene Summary	The protein encoded by this gene is a dual specificity protein kinase that belongs to the MAP kina se kinase family. This kinase is activated by mitogenic and environmental stress, and participates in the MAP kinase-mediated signaling cascade. It phosphorylates and thus activates MAPK14/p3 8-MAPK. This kinase can be activated by insulin, and is necessary for the expression of glucose t ransporter. Expression of RAS oncogene is found to result in the accumulation of the active form of this kinase, which thus leads to the constitutive activation of MAPK14, and confers oncogenic tr ansformation of primary cells. The inhibition of this kinase is involved in the pathogenesis of Yersi na pseudotuberculosis. Multiple alternatively spliced transcript variants that encode distinct isofor ms have been reported for this gene. [provided by RefSeq
