

EGFR CISH Probe

Catalog # CG0017 Size 400 uL

Applications

Chromogenic *In Situ* Hybridization (FFPE Tissue)

Normal nuclei each with two EGFR signals.

Chromogenic *In Situ* Hybridization (Cells)

NSCLC cancer cells with multiple EGFR signals in sputum sample.

Specification

Product Description	EGFR CISH Probe is designed for the qualitative detection of human EGFR gene in formalin-fixed, paraffin-embedded specimens by chromogenic <i>in situ</i> hybridization (CISH).
Reactivity	Human
Recommend Usage	The product is ready-to-use. No reconstitution, mixing, or dilution is required. Bring probe to room temperature (18-25°C) and mix briefly before use.

Supplied Product

Reagent Provided:

1. Digoxigenin-labeled polynucleotides targeting sequences mapping in 7p11.2-7p12* (chr7:55,034, 991-55,380,617) harboring the EGFR gene
2. Formamide based hybridization buffer

*according to Human Genome Assembly GRCh37/hg19

Probe Position

Regulatory Status

For research use only (RUO)

Storage Instruction

Store at 2-8°C in an upright position. Return to storage conditions immediately after use.

Note

The probe is intended to be used in combination with the CISH Implementation Kit 1 (Catalog #: [KA5365](#)), which provides necessary reagents for specimen pretreatment and post-hybridization processing.

Hybridization signals of digoxigenin-labeled polynucleotides appear as brown- to dark brown colored distinct dots.

Normal situation: In interphases of normal cells or cells without an amplification involving the 7p11.2 band, two distinct dot-shaped brown signals per nuclei appear.

Aberrant situation: In a cell with amplification of the EGFR gene locus or aneuploidy of chromosome 7, multiple copies of the brown signal or brown signal clusters will be observed. Other signal distribution may be observed in some abnormal samples which might result in a different signal pattern than described above, indicating variant rearrangements.

Unexpected signal patterns should be further investigated.

Interpretation of Result

Applications

- Chromogenic *In Situ* Hybridization (FFPE Tissue)

Normal nuclei each with two EGFR signals.

- Chromogenic *In Situ* Hybridization (Cells)

NSCLC cancer cells with multiple EGFR signals in sputum sample.

Gene Name

EGFR

Gene Alias

ERBB, ERBB1, HER1, PIG61, mENA

Gene Description	epidermal growth factor receptor (erythroblastic leukemia viral (v-erb-b) oncogene homolog, avian)
Omim ID	131550 211980
Gene Ontology	Hyperlink
Gene Summary	The protein encoded by this gene is a transmembrane glycoprotein that is a member of the protein kinase superfamily. This protein is a receptor for members of the epidermal growth factor family. EGFR is a cell surface protein that binds to epidermal growth factor. Binding of the protein to a ligand induces receptor dimerization and tyrosine autophosphorylation and leads to cell proliferation. Mutations in this gene are associated with lung cancer. [provided by RefSeq]
Other Designations	avian erythroblastic leukemia viral (v-erb-b) oncogene homolog cell growth inhibiting protein 40 cell proliferation-inducing protein 61 epidermal growth factor receptor
