Gene Info — SDCBP

Entrez GeneID	6386
GeneBank Accession#	NM_005625
Protein Accession#	NP_005616
Gene Name	SDCBP
Gene Alias	MDA-9, ST1, SYCL, TACIP18
Gene Description	syndecan binding protein (syntenin)
Omim ID	602217
Gene Ontology	Hyperlink
Gene Summary	The protein encoded by this gene was initially identified as a molecule linking syndecan-mediated signaling to the cytoskeleton. The syntenin protein contains tandemly repeated PDZ domains that bind the cytoplasmic, C-terminal domains of a variety of transmembrane proteins. This protein may also affect cytoskeletal-membrane organization, cell adhesion, protein trafficking, and the activation of transcription factors. The protein is primarily localized to membrane-associated adherens junctions and focal adhesions but is also found at the endoplasmic reticulum and nucleus. Alternative splicing results in multiple transcript variants encoding different isoforms. [provided by RefSeq]
