

MaxPab®

TP53 purified MaxPab mouse polyclonal antibody (B02P)

Catalog # H00007157-B02P

Size 50 ug

Applications

Western Blot (Transfected lysate)

Western Blot analysis of TP53 expression in transfected 293T cell line ([H00007157-T01](#)) by TP53 MaxPab polyclonal antibody.

Lane 1: TP53 transfected lysate(43.23 KDa).

Lane 2: Non-transfected lysate.

Immunofluorescence

Immunofluorescence of purified MaxPab antibody to TP53 on HeLa cell. [antibody concentration 10 ug/ml]

Specification

Product Description

Mouse polyclonal antibody raised against a full-length human TP53 protein.

Immunogen

TP53 (NP_000537.2, 1 a.a. ~ 393 a.a) full-length human protein.

Sequence

Host	Mouse
Reactivity	Human
Quality Control Testing	Antibody reactive against mammalian transfected lysate.
Storage Buffer	In 1x PBS, pH 7.4
Storage Instruction	Store at -20°C or lower. Aliquot to avoid repeated freezing and thawing.

Applications

- Western Blot (Transfected lysate)

Western Blot analysis of TP53 expression in transfected 293T cell line ([H00007157-T01](#)) by TP53 MaxPab polyclonal antibody.

Lane 1: TP53 transfected lysate(43.23 KDa).

Lane 2: Non-transfected lysate.

Gene Info — TP53

Entrez GeneID	7157
GeneBank Accession#	NM_000546
Protein Accession#	NP_000537.2
Gene Name	TP53
Gene Alias	FLJ92943, LFS1, TRP53, p53
Gene Description	tumor protein p53
Omim ID	114480 114500 114550 151623 161550 191170 202300 260350
Gene Ontology	Hyperlink

Gene Summary

This gene encodes tumor protein p53, which responds to diverse cellular stresses to regulate target genes that induce cell cycle arrest, apoptosis, senescence, DNA repair, or changes in metabolism. p53 protein is expressed at low level in normal cells and at a high level in a variety of transformed cell lines, where it's believed to contribute to transformation and malignancy. p53 is a DNA-binding protein containing transcription activation, DNA-binding, and oligomerization domains. It is postulated to bind to a p53-binding site and activate expression of downstream genes that inhibit growth and/or invasion, and thus function as a tumor suppressor. Mutants of p53 that frequently occur in a number of different human cancers fail to bind the consensus DNA binding site, and hence cause the loss of tumor suppressor activity. Alterations of this gene occur not only as somatic mutations in human malignancies, but also as germline mutations in some cancer-prone families with Li-Fraumeni syndrome. Multiple p53 variants due to alternative promoters and multiple alternative splicing have been found. These variants encode distinct isoforms, which can regulate p53 transcriptional activity. [provided by RefSeq]
