Gene Summary	The protein encoded by this gene is a cytokine that belongs to the tumor necrosis factor (TNF) lig and family. This protein is abundantly expressed in endothelial cells, but is not expressed in either B or T cells. The expression of this protein is inducible by TNF and IL-1 alpha. This cytokine is a li gand for receptor TNFRSF25 and decoy receptor TNFRSF21/DR6. It can activate NF-kappaB an d MAP kinases, and acts as an autocrine factor to induce apoptosis in endothelial cells. This cyto kine is also found to inhibit endothelial cell proliferation, and thus may function as an angiogenesis inhibitor. An additional isoform encoded by an alternatively spliced transcript variant has been rep orted but the sequence of this transcript has not been determined. [provided by RefSeq
