Gene Summary	The serine-threonine protein kinase encoded by the AKT1 gene is catalytically inactive in serum-s tarved primary and immortalized fibroblasts. AKT1 and the related AKT2 are activated by platelet-derived growth factor. The activation is rapid and specific, and it is abrogated by mutations in the pleckstrin homology domain of AKT1. It was shown that the activation occurs through phosphatidyl inositol 3-kinase. In the developing nervous system AKT is a critical mediator of growth factor-ind uced neuronal survival. Survival factors can suppress apoptosis in a transcription-independent ma nner by activating the serine/threonine kinase AKT1, which then phosphorylates and inactivates c omponents of the apoptotic machinery. Multiple alternatively spliced transcript variants have been found for this gene. [provided by RefSeq
