Gene Summary	A reciprocal translocation between chromosomes 22 and 9 produces the Philadelphia chromoso me, which is often found in patients with chronic myelogenous leukemia. The chromosome 22 bre akpoint for this translocation is located within the BCR gene. The translocation produces a fusion protein which is encoded by sequence from both BCR and ABL, the gene at the chromosome 9 b reakpoint. Although the BCR-ABL fusion protein has been extensively studied, the function of the normal BCR gene product is not clear. The protein has serine/threonine kinase activity and is a G TPase-activating protein for p21rac. Two transcript variants encoding different isoforms have bee n found for this gene.
