Gene Summary	The product encoded by this gene belongs to the actin family of proteins, which are highly conserv ed proteins that play a role in cell motility, structure and integrity. Alpha, beta and gamma actin iso forms have been identified, with alpha actins being a major constituent of the contractile apparatu s, while beta and gamma actins are involved in the regulation of cell motility. This actin is an alpha actin that is found in skeletal muscle. Mutations in this gene cause nemaline myopathy type 3, con genital myopathy with excess of thin myofilaments, congenital myopathy with cores, and congenita l myopathy with fiber-type disproportion, diseases that lead to muscle fiber defects.
