Product Information

|--------------------|---|
| Gene Summary | This protein belongs to the aldehyde dehydrogenases family of proteins. Aldehyde dehydrogenas e is the second enzyme of the major oxidative pathway of alcohol metabolism. Two major liver isof orms of this enzyme, cytosolic and mitochondrial, can be distinguished by their electrophoretic mo bilities, kinetic properties, and subcellular localizations. Most Caucasians have two major isozym es, while approximately 50% of Orientals have only the cytosolic isozyme, missing the mitochondri al isozyme. A remarkably higher frequency of acute alcohol intoxication among Orientals than am ong Caucasians could be related to the absence of the mitochondrial isozyme. This gene encode s a cytosolic isoform, which has a high affinity for aldehydes. [provided by RefSeq |
