Gene Summary	This gene, CYP3A4, encodes a member of the cytochrome P450 superfamily of enzymes. The cyt ochrome P450 proteins are monooxygenases which catalyze many reactions involved in drug met abolism and synthesis of cholesterol, steroids and other lipids. This protein localizes to the endopl asmic reticulum and its expression is induced by glucocorticoids and some pharmacological age nts. This enzyme is involved in the metabolism of approximately half the drugs which are are used today, including acetaminophen, codeine, cyclosporin A, diazepam and erythromycin. The enzym e also metabolizes some steroids and carcinogens. This gene is part of a cluster of cytochrome P 450 genes on chromosome 7q21.1. Previously another CYP3A gene, CYP3A3, was thought to ex ist; however, it is now thought that this sequence represents a transcript variant of CYP3A4. [provi ded by RefSeq
