Gene Summary	The protein encoded by this gene was originally identified as a 44-kD glycoprotein that interacts with the NEU/ERBB2 receptor tyrosine kinase to increase its phosphorylation on tyrosine residue s. This protein is a signaling protein that mediates cell-cell interactions and plays critical roles in th e growth and development of multiple organ systems. It is known that an extraordinary variety of di fferent isoforms are produced from this gene through alternative promoter usage and splicing. Th ese isoforms are tissue-specifically expressed and differ significantly in their structure, and thereb y these isoforms are classified into types I, II, III, IV, V and VI. The gene dysregulation has been lin ked to diseases such as cancer, schizophrenia and bipolar disorder (BPD). [provided by RefSeq
