Gene Summary	This gene encodes a member of the cysteine-aspartic acid protease (caspase) family. Sequentia l activation of caspases plays a central role in the execution-phase of cell apoptosis. Caspases e xist as inactive proenzymes which undergo proteolytic processing at conserved aspartic residues to produce two subunits, large and small, that dimerize to form the active enzyme. This protein is p rocessed by caspase APAF1; this step is thought to be one of the earliest in the caspase activati on cascade. Alternative splicing results in two transcript variants which encode different isoforms. [provided by RefSeq
