Product Information

Gene Summary	The protein encoded by this gene is a member of the fibroblast growth factor (FGF) family. FGF f amily members possess broad mitogenic and cell survival activities, and are involved in a variety of biological processes, including embryonic development, cell growth, morphogenesis, tissue re pair, tumor growth and invasion. This gene displayed oncogenic transforming activity when transfe cted into mammalian cells. The mouse homolog of this gene exhibits a restricted expression profil e predominantly in the myogenic lineage, which suggested a role in muscle regeneration or differ entiation. [provided by RefSeq
