Gene Name ADRB2

Gene Alias ADRB2R, ADRBR, B2AR, BAR, BETA2AR

Gene Description adrenergic, beta-2-, receptor, surface

Omim ID [109690 600807 601665](#)

Gene Ontology [Hyperlink](#)

Gene Summary This gene encodes beta-2-adrenergic receptor which is a member of the G protein-coupled receptor superfamily. This receptor is directly associated with one of its ultimate effectors, the class C L-type calcium channel Ca(V)1.2. This receptor-channel complex also contains a G protein, an adenylyl cyclase, cAMP-dependent kinase, and the counterbalancing phosphatase, PP2A. The assembly of the signaling complex provides a mechanism that ensures specific and rapid signaling by this G protein-coupled receptor. This gene is intronless. Different polymorphic forms, point mutations, and/or downregulation of this gene are associated with nocturnal asthma, obesity and type 2 diabetes. [provided by RefSeq]
